API endpoints:

http://34.207.72.173/market - returns last 100 days of market data for Dow Jones, S&P, FTSE100, Nikkei and Hang Seng Index in json format http://34.207.72.173/getCSV - returns all available market data in csv format

 $\frac{\text{http://3.85.238.79//api/v1.0/pandemic/corona}}{\text{location in json format}} - \text{returns coronavirus case informations} \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{http://3.85.238.79//api/v1.0/pandemic/getCSV}}{\text{location in json format}} - \text{returns all available epidemic data in csv format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\ \frac{\text{location in json format}}{\text{location in json format}} - \text{location in json format} \\ \\$

COVID Dataset ETL:

- Ingest CSV file from (<u>https://console.aws.amazon.com/dataexchange/home?region=us-east-1#/products/prod</u>view-gsdi4ujyb4gfy) into python
- 2. Dropped any unnecessary columns and renamed columns for easier use.
- 3. Pivoted the Case Type and Cumulative Cases columns so we can have them as rows for easier used in upcoming analysis
- 4. Dropped any rows that contained zero's across all metric columns in order to get rid of unnecessary rows and shrink file size.
- 5. Saved both 2 clean copies (1) original file with dropped and renamed columns (2) pivoted data.

Twitter Sentiment Analysis:

Collected the Corona tweets for March 30th. We have applied for API access but never got approved by Twitter.

Data Cleaning: (Step 1)

(https://github.com/maheshdivan/Project_Pandemic/blob/master/Tweet_Sent_Analysis/tweet_sentiment_analysis.ipynb)

Loaded data into S3 for storage

Used Pyspark to perform data cleaning activity on the tweets.

Steps:

- 1. Removed unnecessary columns
- 2. Using regex removed URL links User IDs and Hash tags from tweets
- 3. Removed non-English words from tweet

Sentiment Analysis (Step 2)

(https://github.com/maheshdivan/Project_Pandemic/blob/master/Tweet_Sent_Analysis/runsent.py)

Libraries used are

Python Natural Language Toolkit (nltk)

SklearnClassifier

Pickle

Sklearn. Naive Bayes

Sklearn linear model

Sklearn SVM

NItk tokenize

Method used for Sentiment Analysis: (Arriving at a model)

Created a text file of positive and negative reviews (These are actually taken from movie reviews)

Using above file, using nltk parts of speech module (nltk.pos_tag), tagged each word, which will give each word a tag with parts of speech

POS tag list:

```
coordinating conjunction
CC
CD
     cardinal digit
     determiner
DТ
EΧ
     existential there (like: "there is" ... think of it like "there
exists")
     foreign word
FW
     preposition/subordinating conjunction
ΙN
JJ
     adjective 'big'
JJR adjective, comparative
                               'bigger'
    adjective, superlative
                              'biggest'
JJS
    list marker
LS
                    1)
     modal could, will
MD
    noun, singular 'desk'
NN
NNS noun plural
                    'desks'
     proper noun, singular 'Harrison'
NNP
NNPS proper noun, plural
                         'Americans'
     predeterminer 'all the kids'
PDT
POS possessive ending parent\'s
PRP
     personal pronoun
                         I, he, she
PRP$ possessive pronoun
                         my, his, hers
               very, silently,
RB
     adverb
RBR adverb, comparative better
RBS
    adverb, superlative best
RP
     particle give up
          go 'to' the store.
TO
UH
     interjection errrrrrrm
     verb, base form take
VB
VBD
    verb, past tense
                          took
VBG
    verb, gerund/present participle taking
VBN
    verb, past participle taken
    verb, sing. present, non-3d
VBP
                                    take
VBZ
    verb, 3rd person sing. present takes
WDT
    wh-determiner
                    which
WP
     wh-pronoun who, what
```

```
WP$ possessive wh-pronoun whose WRB wh-abverb where, when
```

From the above list, we were only interested in words which are Adjectives, which are part of speech words starting with "J"

Performed above step for positive and negative reviews and stored this as document.pickle files. (Pickle is used to store these for faster training)

Created a frequency distribution of words for selecting 5000 words, store this as well as pickle file

Created a feature set using documents from above list and create a dictionary.

From the featureset create a testing and training set and use above for training each of the algorithms used

- 1. nltk.NaiveBayesClassifier
- 2. SklearnClassifier(MultinomialNB()
- 3. SklearnClassifier(BernoulliNB()
- SklearnClassifier(LogisticRegression()
- 5. SklearnClassifier(LinearSVC()
- 6. SklearnClassifier(SGDClassifier()

Pickle the models from all the above step for predicting a new dataset

Above steps were used for creating the initial model

Sentiment Analysis Module:

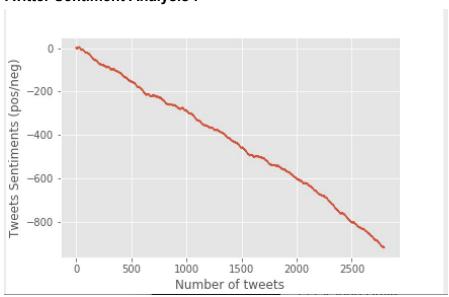

https://github.com/maheshdivan/Project_Pandemic/blob/master/Tweet_Sent_Analysis/sentiment_mod.py

Created a module sentiment_mod.py using above steps and added a voting for each classified which will give a confidence value for each classifier. In this module all the detailed steps were removed by using picked modules from initial steps mentioned above.

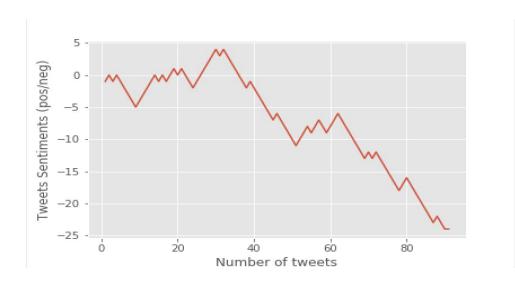

Sentiment Analysis and Plotting: (Using model for predicting and Plotting): (Step 2)

Using the tweets CSV file, used 2500 tweets to derive the sentiment out of each tweet from the cleaned data set from step 1. Selected the tweets which has more than 80% confidence level for writing into a tweet sentiment analysis file for plotting. Using this file, plot the sentiment by assigning +1 for positive sentiment and -1 for each negative sentiment.

Twitter Sentiment Analysis:

Ran for 100 tweets to see the variation in positive and negative sentiment

Corona ML:

(https://github.com/maheshdivan/Project Pandemic/tree/master/Corona Curve ML)

We have used same dataset used for visualization which has been cleaned using python data cleaning

(https://github.com/maheshdivan/Project Pandemic/blob/master/ETL/ETL-covid19.ipynb)

For predicting the when curve will flatten, we have used sigmoid function.

Approach:

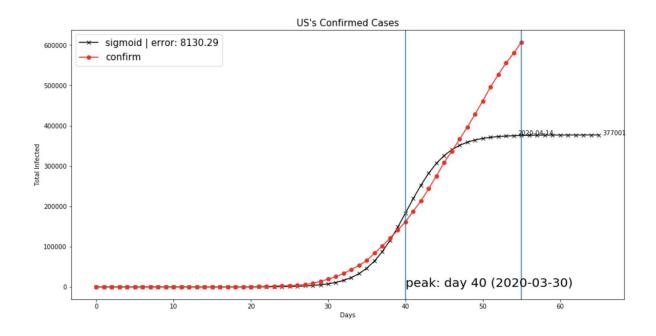

From the cleaned dataframe, removed the unnecessary columns like confirmed and deaths as we will be using cumulative data for prediction.

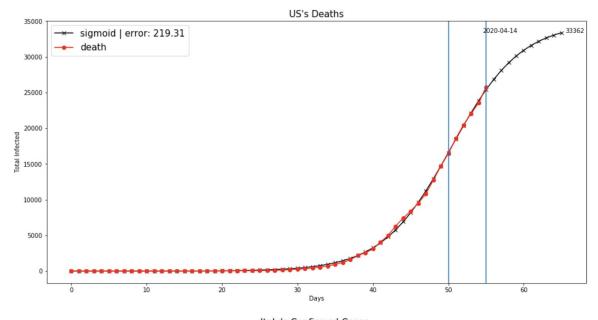

Created a sigmoid function and using scipy curve fit function, calculated popt and pcov. We used popt value to calculate the peak day for confirmed cases and deaths. We have used the 'dogbox' algorithm for minimization.

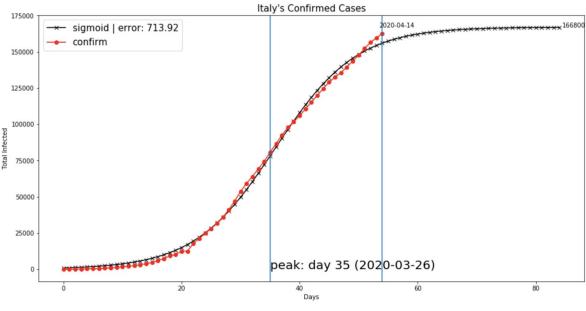

Variable inception is used based on data when most of the cases started to arrive. For "US", we have set it as 28 days from the start of the dataset. For Italy, it is set as 20. For China it is zero.

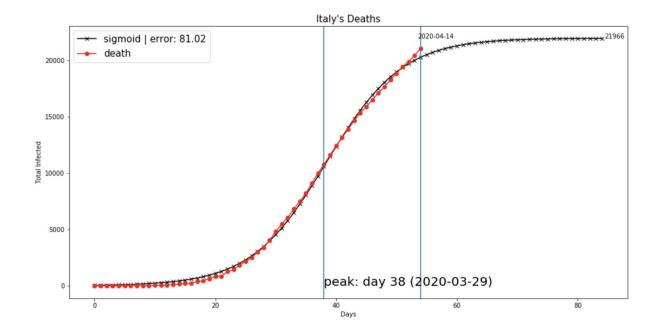

Curve fit scipy function needs bounds for the sigmoid curve this has been taken by trial and error method because too many big values give error as the curve ft function has reached maximum value.

Then plotted the actual and the Sigmoid curve to see how actual and predicted curves look.

Predictions of confirmed cases and death are done based on sigmoid function

Confirmed cases (US):

Predictions:

2020-04-15: 376134

2020-04-16: 376417

2020-04-17: 376611

2020-04-18: 376744

2020-04-19: 376835

2020-04-20: 376897

2020-04-21: 376939

2020-04-22: 376968

2020-04-23: 376988

Deaths (US):

Predictions:

2020-04-15: 26809

2020-04-16: 28066

2020-04-17: 29165

2020-04-18: 30113

2020-04-19: 30921

2020-04-20: 31603

2020-04-21: 32174

2020-04-22: 32649

2020-04-23: 33040
